**RE: MCCRAE LANDSLIDE INCIDENT
 DISPLACEMENT MONITORING UPDATE - 7 MARCH 2025 TO
 13 MARCH FEBRUARY 2025**

1. Introduction

This memo provides a summary of displacement monitoring data collected between 00:00 AM 7 March and 11:59 PM 13 March 2025 (the Monitoring Period) at the McCrae Landslide Incident (the Site). Details of the monitoring systems and the monitoring procedure are to be provided in an Instrumentation and Monitoring Plan that is currently being drafted.

The plan location of monitoring points is shown in Figure 1.

Monitoring data and relevant plots of monitoring data are provided in Appendix A to Appendix G.

Monitoring memorandums issued to date are provided in Table 1.

Table 1 – Monitoring memorandums

Date Range	Document Reference	Comment
All monitoring to week ending 28 February 2025	PSM5665-050M (M1)	Issued 06/03/2025
28 February 2025 to 6 March 2025	PSM5665-052M (M2)	Issued 12/03/2025
7 March 2025 to 13 March 2025	PSM5665-054M (M3)	-

2. Monitoring System updates

During the Monitoring Period the following events related to the monitoring system occurred:

- GPS03 recommenced transmitting data on 7 March 2025. Cellular reception in this area is poor, hence data transmission is currently intermittent. An upgrade of the antenna to mitigate poor reception is scheduled in the next one to two weeks.
- GPS05 and GPS06 were installed on 7 March 2025.
- GPS05 and GPS06 were activated on 10 March 2025.

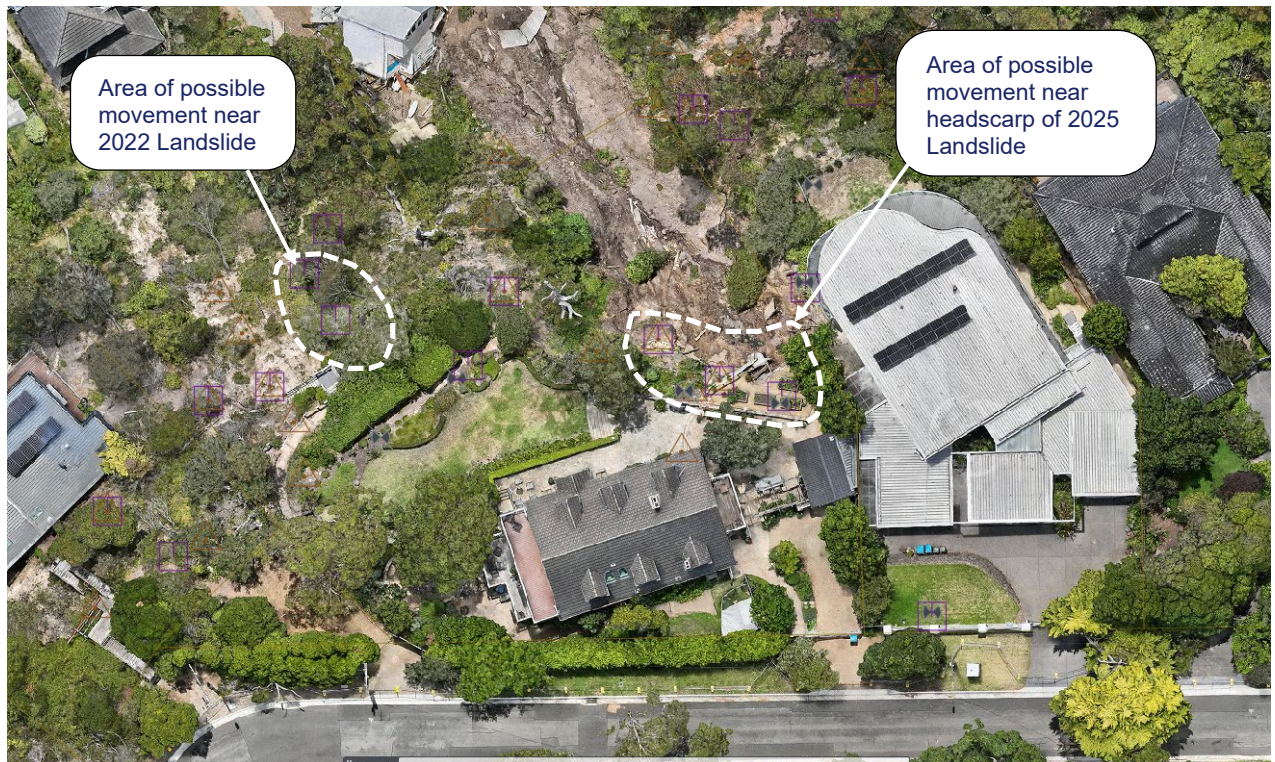

3. Discussion

3.1 Displacement Monitoring

We note the following:

- Regarding GPS:
 - GPS01, GPS02, GPS03 and GPS04 instruments show small amounts of movement (less than 5 mm), Appendix A to Appendix B. Previously reported elevated measurements (refer M2) have returned to within the stated error of the instruments (+/- 5 mm).
 - GPS05 and GPS06 show 5 mm and 6 mm of total movement respectively. They currently exceed the stated error of the instruments (+/- 5 mm). The major component of the total movement is from changes in elevation. For all instruments the elevation measurements are observed to have high day to day fluctuation. Elevation fluctuations of up to 33 mm movement have been measured between successive days.
 - The observed movement for all instruments to date is inferred to be instrument noise. A general trend of displacement cannot be recognised and therefore measurements may not be reflective of actual ground movement.
- Regarding survey prisms:
 - All survey prisms (excluding S5P26, S6P34, S6P35, S6P36) show less than 2 mm of displacement since the baseline survey commenced, Appendix C to Appendix E. This is within the accuracy of the survey instrument and no conclusions regarding trends can be made at this time.
 - Survey Prism S5P26 shows 3 mm of displacement to the northeast. Expected slope movement at this location is to the north or northwest. It is likely measured displacement is survey inaccuracy rather than ground movement. This will be checked at the next survey.
 - Survey prisms S6P34, S6P35 and S6P36 all show the same 4 mm of displacement to the southeast. All three prisms are measured from the same resection (i.e. position). Therefore, the measured displacement is inferred to be a result of inaccuracy in survey setup, not ground movement. This will be checked on the next survey.
- Regarding tilt sensors:
 - All tilt sensors continue to show a diurnal response, with a common pattern of changes in tilt occurring across the day. A change in tilt is inferred to be linked to changes in temperatures with strong changes in tilt occurring in response to changes in temperature.
 - Most tilt sensors are starting to display a steady day-to-day pattern of rotation. Typically, the range of tilt measurements is between -0.05° and 0.05° , with no trend of increasing rotation, Appendix F.
 - The following tilt sensors are showing a trend of increasing rotation:
 - TS02
 - TS06
 - TS08
 - TS12
 - TS17
 - TS19
 - TS20

- TS02 is located on the slopes above 14-16 View Point Rd. TS02 is showing an increase in rotation over the last two weeks. The magnitudes of tilts are currently low (0.02°). Survey prism S5P28 is co-located with TS02, however the prism is showing no movement. The sensitive nature of the tilt sensors may be detecting early signs of movement. However, as the magnitude of tilt is small and the survey prisms are not recording any movement the nature of the possible movement is not yet clear.
- TS06, TS08 and TS17 were previously reported (refer M1 & M2) as showing higher than typical rotation as well as an increasing trend of rotation. This trend has continued with further increases in rotation. All instruments are located near the eastern flank of the 2022 Landslide in an area of softened and wet ground. This area is highlighted in Inset 1. No survey prisms or GPS are located in this location, so the movement is not easily calibrated. These three results indicate that there could be ground movement occurring in this location.
- TS19 is located below the house at 22 View Point Rd and is showing a trend of increasing rotation over the last 2 weeks. The magnitudes of tilts are currently low (0.02°). Survey prism S5P25 is co-located with TS19, however the prism is showing no movement. The sensitive nature of the tilt sensors may be detecting early signs of movement. However, as the magnitude of tilt is small and the survey prisms are not recording movement greater than the survey accuracy, the nature of the possible movement is not yet clear.
- TS12, TS20 are all located in close proximity to the head scarp of the landslide in 10-12 View Point Rd. This area is highlighted in Inset 1. These instruments were previously reported (refer PSM5665-050M) as showing higher rotations relative to other tilt sensors as well as a trend of increasing rotation. In the current Monitoring Period they are recording higher than typical rotations, however the trend of rotation has steadied or reversed.
 - TS12 and TS20 in the first one to two weeks of monitoring both showed an increasing trend of rotation. Since the direction of rotation reversed and both instruments now show a trend of decreasing rotation in the current Monitoring Period.
 - GPS instruments and survey prisms at these locations (GPS02, S3P12, S3P13 S3P14) have little to no displacement recorded outside of the instrument accuracy. However, the tilt sensors are highly sensitive instruments and typically detect ground movements in advance of other less sensitive instruments (e.g. survey prisms, GPS). The movement recorded in the tilt sensors indicates that small ground movements previously reported may be continuing.
- Regarding Radar Monitoring:
 - Continued small amounts of movement over the Monitoring Period (approximately 10 mm) was observed in Areas 8, Appendix G. The movement mechanisms are not fully understood nor is the ground model refined at this time. The movement at Area 8 is localised and occurring in over steepened material on very steep slopes.
 - Movement previously reported in Areas 3 and 6 (refer M2), has slowed and remained relatively steady over the Monitoring Period.
 - Note that Area 8, Appendix G, is located adjacent to Tilt Sensors TS20. Like TS20, the movement in Area 8 is fluctuating but showing a trend of continued movement.
 - The radar sensitivity of Area 8 is approximately 0.25, which means that movements detected by the radar may only represent 25% of the actual movement that is occurring. Over this Monitoring Period 10 mm of recorded movement is therefore equal to 40 mm of relative movement.
 - The combination of movement in the radar and tilt sensor support that movement is continuing in the rear scarp and flanks of the 2025 Landslide. The movement in Area 8 may represent surficial ravelling or may represent early stages of regressive slumping or sliding.

Inset 1: Aerial image, with possible areas of movement highlighted as dashed white line

4. Next Monitoring Update

The next round of monitoring data collection and reporting is scheduled as follows:

- Next scheduled prism survey: 27 March 2025
- Next issue of monitoring report: 31 March 2025.

Should you have any queries related to this report please contact the undersigned.

Yours Sincerely
